MayaLens Interpretable Report

Integrated Deepfake Detection powered by Explainable AI

Final Decision: REAL

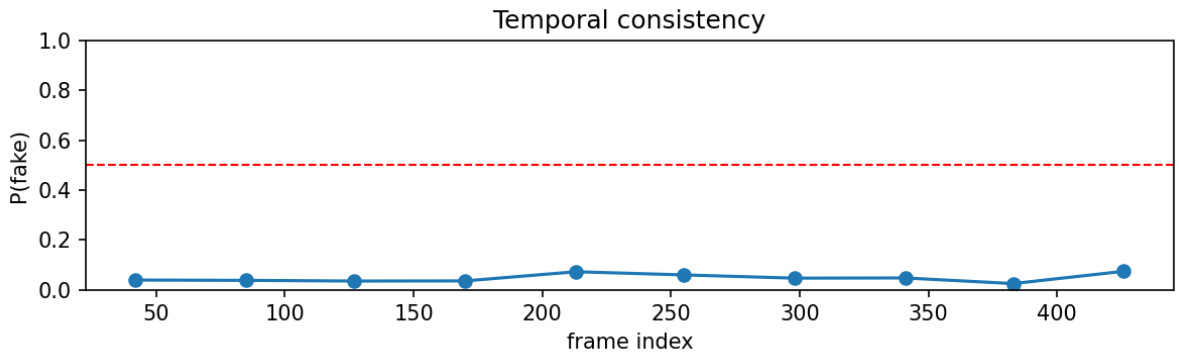

Confidence Level: **95.3%** | mean P(fake) = 0.047 | frames analysed: 10

Model stream	Mean P(fake)
EfficientNet	0.022
ViT	0.510
Frequency	0.612
Fused (final)	0.047

Media metadata verification

file	id36_0006.mp4
media_type	video
size_bytes	2261950
total_frames	470
sha256	bf15d2cd767fa0217defe87085ef621c03e29261c70fb9518e8c196dadfef1f4
model	MayaLens.h5 (EfficientNet-B4 + ViT + Freq-ResNet18)

Frame-by-frame temporal consistency

Key Frame Breakdowns

Key frame #127 — P(fake)=0.035

Text explanation: The local (LIME) explanation attributes the REAL decision mainly to natural, consistent facial texture around the face boundary / blending seam, jaw / chin contour and forehead / hairline.
Grad-CAM/Grad-CAM++ show EfficientNet's artefact evidence (warm colours = strongest influence).

Key frame #170 — P(fake)=0.035

Text explanation: The local (LIME) explanation attributes the REAL decision mainly to natural, consistent facial texture around the forehead / hairline, face boundary / blending seam, jaw / chin contour and eyes and eyebrows.
Grad-CAM/Grad-CAM++ show EfficientNet's artefact evidence (warm colours = strongest influence).

Key frame #383 — P(fake)=0.025

Text explanation: The local (LIME) explanation attributes the REAL decision mainly to natural, consistent facial texture around the face boundary / blending seam, eyes and eyebrows and nose and cheeks.
Grad-CAM/Grad-CAM++ show EfficientNet's artefact evidence (warm colours = strongest influence).

Heat-maps show where the model looked, not proof of manipulation. Treat as decision support and combine with provenance checks (e.g. C2PA) and human review for legal or journalistic use.
